

SONICFIRE PRO 5 SCORING EDITION

Express Track Edition Included

All of the features of Sonicfire Pro 5 Express Track Edition are included in the Scoring Edition.

Multitrack Timeline with Video

Scoring Edition features a familiar multitrack timeline interface that includes unique SmartSound features that add new levels of creative control. A video window is also available for you to synchronize the music precisely to your video sequence.

Mood Mapping

Mood Keyframes

Set Mood keyframes to change the instrument mix at precise points on the timeline.

What's your Mood?

Set the Mood (or instrument mix) for any area on the timeline. Select a preset Mood Mix from the dropdown list or adjust the sliders to get the perfect custom mix.

Transition Time

Control the transition between moods with this slider. Make a subtle transition by setting it longer or set it to zero to make an immediate transition that emphasizes a change in your video.

Moving Moods

If you want to change the location of a Mood keyframe, just click and drag it to a new point on the timeline.

Timing Control

SmartSound has been relentless in providing solutions to overcome the limitations of traditional library music by empowering a new level of creativity through technological innovation. Sonicfire Pro 5's Timing Control features are the biggest new innovation in customizing library music. Now you can adjust when the section changes occur in a track or move a perfect musical beat to match an event in your video. Simply select the "Timing Control" option and these new controls are at your fingertips.

Beat Alignment

When working with music and picture, you will inevitably need to emphasize an event or transition with a distinct musical change. With Sonicfire Pro 5's new beat alignment capability, you can now grab a beat and move it to align perfectly with the events in your picture.

With "Snap to Beat" enabled, your new change will be in rhythm and the total length of the track will be automatically preserved.

Section Changes

If a song starts out slow and develops too quickly for your video, you can now simply change the music sections to allow more time before the song develops into its full sections.

You can easily control the arrangement of the song to conform to the dynamic changes in your story.

Insert Hit Files

When an event on screen calls for a musical hit or sound effect, the new "Insert Hit File" feature will come in handy. Sonicfire Pro 5 Scoring Edition comes with a collection of cymbal swells and crashes, whooshes, and dozens of other sounds that are ideal for highlighting a specific event in your scene.

Perfect Position

Since hit files have their peak sound at different times, Sonicfire Pro 5 automatically adjusts each hit file so that its peak is exactly where you want it.

Cycle Through Hits

A keyboard shortcut allows you to quickly cycle through all of the available hit files. It will automatically play 2 second before and after your hit file so you can quickly hear which one works best.

Spotting Tools

The new Spotting feature of Sonicfire Pro 5 lets you set the important music markers along any imported video sequence. Mark the music in and out points and also mark key events in your scene that need support of a well-timed change in the music. Once you've set your markers, the Spotting tool will turn your visual cues into a list of music search results that are ideally suited for the duration and pacing of your markers.

Smart Recall

Smart Recall is another great innovation from SmartSound. Every music file created by Sonicfire Pro works as a standard audio file in all of your media applications, but it also retains full customization control. If you wanted to change the length or adjust the mix of any other library music, it would be nearly impossible. With Smart Recall, your music files will open in Sonicfire Pro with the settings that were used to create the file. Make some quick adjustments to the length, variation or mix and update the original or save a copy with your new settings.
